## Product Description

### 40~1000 Liter Degreasing and Derusting Industrial Ultrasonic Cleaning Machine with Heater

The ultrasonic cleaning machine equipment uses ultrasonic to clean the workpiece, so that particles, oil stains, etc. attached to the workpiece fall off or dissolve or emulsify with the mechanical vibration of the ultrasonic, so as to achieve the purpose of cleaning the workpiece. In principle, the core part of the ultrasonic cleaning equipment should be the role of ultrasound. The ultrasonic part of the ultrasonic cleaning machine equipment is divided into two major parts; one is an ultrasonic transducer (or ultrasonic head); the other is an ultrasonic generator, which converts the electrical signal provided by the ultrasonic generator into Mechanical vibration.

Principle of ultrasonic cleaning equipment

First, the signal generator generates a signal with a specific frequency. This signal can be a sinusoidal signal or a pulse signal. This specific frequency is the frequency of the transducer. Generally, the ultrasonic frequencies used in ultrasonic equipment are 25KHz and 28KHz. , 35KHz, 40KHz; 10KHz or above has not yet been widely used. But with the continuous development of precision cleaning in the future. I believe that the use will gradually expand.
