How does an ultrasonic cleaner work?

An ultrasonic system works by inducing controlled cavitation in the cleaning fluid. Cavitation refers to microscopic voids or 'bubbles' that form when the transducers emit sufficient ultrasonic energy into the fluid. The cavitation bubbles form relatively slowly and then collapse suddenly, releasing tremendous energy against the surfaces of objects immersed in the tank that 'scrubs' hard to remove soils from the parts.

No damage to the cleaned items.

Benefits of ultrasonic cleaning:

- Used for a wide range of workpiece shapes, sizes and materials
- The ultrasonic cleaning process gently moves parts to assist with cleaning; this mitigates the risk of damage to industrial parts during cleaning
- May not require the part to be disassembled prior to cleaning. Lower labor costs equal increased profits.
- Water, soap and green-friendly solvents are environmentally safe. Ultrasonic cleaning reduces/replaces hazardous cleaning solvents
- Short cycle times save time, money and increase plant efficiency
