How does the ultrasonic vibration plate works?

The application principle of the ultrasonic vibration plate is that the high-frequency oscillation signal sent by the ultrasonic generator is converted into high-frequency mechanical oscillation by the transducer and propagated to the medium. The flow of liquid produces tens of thousands of tiny bubbles. The tiny bubbles (cavitation nuclei) in the liquid vibrate under the action of the sound field. When the sound pressure reaches a certain value, the bubbles grow rapidly, and then suddenly close, and the bubbles close. When a shock wave is generated, thousands of atmospheric pressures are generated around it, destroying insoluble dirt and dispersing them in the cleaning fluid. When the group particles are wrapped in oil and adhere to the surface of the cleaning part, the oil is emulsified, and the solid particles are Separation, so as to achieve the purpose of cleaning the surface of the cleaning part.

Application:

Immersible ultrasonic transducers are sealed stainless steel enclosures, to make a exist tank become a ultrasonic tank. The number and placement of the submersible ultrasonic cleaning transducers is primarily determined by the volume of liquid in the tank, geometric layout of the existing tank, and load size of the parts. Depending on the size of the tank and parts cleaning application, the Watts of ultrasonic power per gallon or Watts/gal can vary from 30 to 100+ W/gal.
